AB In the engineering design activity for ITER, a test coil named QUench Expts. on Long Length (QUELL), using 91 m and 1/5-size ITER superconducting conductor, was fabricated by JAERI. The performance tests were carried out at the SULTAN facility in Switzerland where quench propagation, thermal and hydraulic characteristics were determined and development and test of new quench detection system were conducted. The thermal and hydraulic behavior was not known well. This conductor has a central channel to reduce the pressure drop. To study the thermal and hydraulic characteristic of the conductor, the pressure drop was measured at 5-13 K and 2-11 g/s, and the friction factor of the central channel was calculated. In heat slug propagation, an inductive and resistive heater on the conductor was used and the velocity of the heat front and input energy are

estimated from the temperature change of conductor.

AB QUELL exptl. results concerning critical current, current sharing temperature,  
quench propagation and thermohydraulic quench back are reported. A short  
description is given of the experiment followed by a detailed anal. of the  
quench propagation expts. An important correlation for the temperature margin,  
operating current and time dependence of the normal zone length have been  
found.

AB The environmental acceptability of recycling bricks, calcareous sandstone,  
porous concrete, lightwt. concrete with expanded clay or pumice as  
aggregate, lightwt. lime-cement plaster, foamed glass-containing plaster,  
lightwt. mortar, and thermally insulating plaster was evaluated. The  
evaluation comprised heavy metals and their leachability. Only few  
materials would require disposal in landfills.

AB Prostate-specific antigens (PSA) were determined in serum of a total of 234 samples from patients grouped according to age by Stratus PSA test and compared to enzymeimmunoassay tests on ES 300 and IMX analyzers. The Stratus test correlated well with the IMX test. A significant increase in standard deviation was observed in the group of patients over 40. This indicates a general need for screening in men over 40.

DOCUMENT TYPE: Journal  
LANGUAGE: English

AB A search for  $\mu \rightarrow e$  conversion in muonic atoms is being performed at PSI with the SINDRUM II spectrometer. A first measurement on Ti gives upper limits on the branching ratios for the ground-state transitions of  $\Gamma(\mu\text{-Ti} \rightarrow e\text{-Ti g.s.})/\Gamma(\mu\text{-Ti capture}) < 4.3 + 10^{-12}$  and  $\Gamma(\mu\text{-Ti} \rightarrow e\text{-Ca g.s.})/\Gamma(\mu\text{-Ti capture}) < 4.3 + 10^{-12}$  (90% confidence). With the assumption of a giant resonance excitation of the Ca nucleus the limit on the total rate for  $\mu^- \rightarrow e^+$  conversion is  $\Gamma(\mu\text{-Ti} \rightarrow e^+\text{-Ca}^+)/\Gamma(\mu\text{-Ti capture}) < 8.9 + 10^{-11}$ .

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB The use is disclosed of one or more of

(a) a polyquaternary compound,

(b) a thickening agent or dispersing agent,

(c) a nonionic surfactant having from 3 to 12 alkylene oxide, preferably ethylene oxide, units,

(d) a simple quaternary compound in an amount at least equal to the

amount of isothiazolone in the solution,

to prevent stripping of isothiazolone in an isothiazolone-containing solution used as an anti-sapstain agent in wood treatment, where the solution is recurrently contacted with wood.

GI For diagram(s), see printed CA Issue.

AB Ni(CO)<sub>4</sub>-induced opening of the 3-membered ring in spiro[2.4]hepta-4,6-diene is directed by Me and vinyl substituents. A Me group at C(1) hinders, and a vinyl group enhances, opening of the adjacent 3-membered ring C-C bond. The products are  $\sigma$ -alkyl- and  $\sigma$ -acyl- $\pi$ -cyclopentadienyl complexes, e.g., I, and dinuclear systems, e.g., II. The  $\mu$ -[1,5-di( $\eta$ 5-cyclopentadienyl)-3-pentanone] ligand in II is formed by carbonylation and coupling of 2 spiroheptadiene units.

AN 1979-H9884B [38] WPIDS

AB DE 2809646 A UPAB: 19930901

The cartridge contains a number of separate ingredients, which after mixing together are force out of the cylindrical body by a piston and through a nozzle. The piston accommodates one of the ingredients and is cup-shaped, having a port in its crown which can be sealed.

An auxiliary piston inside the main piston forms a seal as it slides in it until it encounters the crown. Further movement of the auxiliary piston moves the main piston so as to extrude the mixture of the material initially inside the piston and that inside the main part of the cartridge.

SOURCE: Biochimica et Biophysica Acta (1974), 341(2), 465-83  
CODEN: BBACAQ; ISSN: 0006-3002

DOCUMENT TYPE: Journal

LANGUAGE: English

AB In *S. pombe* 2 isoenzymes of malate dehydrogenase were found which differ markedly in their response to glucose. One isoenzyme is synthesized only in glucose-repressed cells and disappears during respiratory derepression. The synthesis of the other form starts after glucose has been reduced by assimilation to a concentration of .apprx.1.0 g/l. Fully derepressed cells contain exclusively this second isoenzymic form, which is rapidly inactivated after addition of glucose, probably by an enzymic-catalyzed

chemical

modification. Inhibition of derepression by antibiotics indicates that this isoenzyme is synthesized by cytoplasmic and not mitochondrial ribosomes. Both isoenzymes were purified 600-fold with about the same yield to electrophoretic homogeneity. Three mg of pure enzyme were isolated from glucose-repressed as well as derepressed cells of this fission yeast. Thus, the intracellular concentration of the enzymes is about

the

same in both physiol. states. The glucose-repressible isoenzyme is therefore 20-fold as active as the isoenzyme synthesized in the presence of glucose. Both isoenzymes possess a mol. weight of 60,000, are composed of 2 subunits identical in mol. weight and show the same sensitivity to inhibition by high concns. of oxaloacetate, corresponding to the cytoplasmic forms of malate dehydrogenase from mammalian cells. The apparent Michaelis consts., and the pH and temperature optima are similar for both forms. The isoenzymes differ in their isoelec. points and their amino acid compns.

DOCUMENT TYPE: Journal

LANGUAGE: English

AB One isoenzyme of malate dehydrogenase with an isoelectric point of 6.4 was found in glucose-repressed cells of *S. pombe*. During respiratory derepression the activity of this isoenzyme decreased rapidly in vivo. In the course of this inactivation 2 new forms of malate dehydrogenase with isoelectric points of 6.0 and 5.7 appeared. These 2 enzymic forms disappeared 4 hr after the exhaustion of glucose; probably they are degradation products of the isoenzyme present in glucose-repressed cells. Fully derepressed cells of this fission yeast contained 1 isoenzyme of malate dehydrogenase with an isoelectric point of 5.3. The synthesis of this isoenzyme was initiated at glucose concns. <1.5 g/l.

AB In the engineering design activity for ITER, a test coil named QUench Expts. on Long Length (QUELL), using 91 m and 1/5-size ITER superconducting conductor, was fabricated by JAERI. The performance tests were carried out at the SULTAN facility in Switzerland where quench propagation, thermal and hydraulic characteristics were determined and development and test of new quench detection system were conducted. The thermal and hydraulic behavior was not known well. This conductor has a central channel to reduce the pressure drop. To study the thermal and hydraulic characteristic of the conductor, the pressure drop was measured at 5-13 K and 2-11 g/s, and the friction factor of the central channel was calculated. In heat slug propagation, an inductive and resistive heater on the conductor was used and the velocity of the heat front and input energy are estimated from the temperature change of conductor.

AB QUELL exptl. results concerning critical current, current sharing temperature, quench propagation and thermohydraulic quench back are reported. A short description is given of the experiment followed by a detailed anal. of the quench propagation expts. An important correlation for the temperature margin, operating current and time dependence of the normal zone length have been found.

AUTHOR(S): Hilgenfeldt, J.; Heer, Birgit; Lochner, Dagmar; Danninger, J.

CORPORATE SOURCE: Reha-Zentrum, Bundesanst. Arbeit, Bad Kissingen, D-97688, Germany

SOURCE: Laboratoriumsmedizin (1995), 19(7/8), 354-7  
CODEN: LABOD3; ISSN: 0342-3026

PUBLISHER: Blackwell

DOCUMENT TYPE: Journal

LANGUAGE: German

AB Prostate-specific antigens (PSA) were determined in serum of a total of 234 samples from patients grouped according to age by Stratus PSA test and compared to enzymeimmunochem. tests on ES 300 and IMX analyzers. The Stratus test correlated well with the IMX test. A significant increase in standard deviation was observed in the group of patients over 40. This indicates a general need for screening in men over 40.

DOCUMENT TYPE: Journal

LANGUAGE: English

AB A search for  $\mu \rightarrow e$  conversion in muonic atoms is being performed at PSI with the SINDRUM II spectrometer. A first measurement on Ti gives upper limits on the branching ratios for the ground-state transitions of  $\Gamma(\mu\text{-Ti} \rightarrow e\text{-Ti g.s.})/\Gamma(\mu\text{-Ti capture}) < 4.3 + 10^{-12}$  and  $\Gamma(\mu\text{-Ti} \rightarrow e\text{-Ca g.s.})/\Gamma(\mu\text{-Ti capture}) < 4.3 + 10^{-12}$  (90% confidence). With the assumption of a giant resonance excitation of the Ca nucleus the limit on the total rate for  $\mu^- \rightarrow e^+ \text{ conversion is } \Gamma(\mu\text{-Ti} \rightarrow e^+\text{-Ca}^*)/\Gamma(\mu\text{-Ti capture}) < 8.9 + 10^{-11}$ .

AN 1980-86529C [49] WPIDS

AB DE 2920915 A UPAB: 19930902

Pressure forming piston used in a hollow cylindrical container for plastic materials especially for cartridges with a piston head curved outwards and a piston wall fitted with a ring shaped sealing lip in the area leading to the piston head and also fitted with several ring shaped projections on its outer surface.

A pressure plate curved in the opposite direction to the piston head is inserted into the interior of the pressure forming piston adjoining with its edge of the area of the crossover between piston head and piston wall. The pressure plate is fitted with  $\geq 1$  stop cam projecting towards the piston head.

AB Ni(CO)<sub>4</sub>-induced opening of the 3-membered ring in spiro[2.4]hepta-4,6-diene is directed by Me and vinyl substituents. A Me group at C(1) hinders, and a vinyl group enhances, opening of the adjacent 3-membered ring C-C bond. The products are  $\sigma$ -alkyl- and  $\sigma$ -acyl- $\pi$ -cyclopentadienyl complexes, e.g., I, and dinuclear systems, e.g., II. The  $\mu$ -[1,5-di( $\eta$ 5-cyclopentadienyl)-3-pentanone] ligand in II is formed by carbonylation and coupling of 2 spiroheptadiene units.

AB Spiro[2.4]hepta-4,6-diene and spiro[4.4]nona-1,3-diene both react with Co<sub>2</sub>(CO)<sub>8</sub>, to give substituted dicarbonyl-η<sup>5</sup>-cyclopentadienylcobalt complexes (e.g. I, II, R = Et, vinyl) by disproportionation, coupling, or recyclization of the ring-opened intermediates.

AN 1979-H9884B [38] WPIDS

AB DE 2809646 A UPAB: 19930901

The cartridge contains a number of separate ingredients, which after mixing together are force out of the cylindrical body by a piston and through a nozzle. The piston accommodates one of the ingredients and is cup-shaped, having a port in its crown which can be sealed.

An auxiliary piston inside the main piston forms a seal as it slides in it until it encounters the crown. Further movement of the auxiliary piston moves the main piston so as to extrude the mixture of the material initially inside the piston and that inside the main part of the cartridge.

AB In *S. pombe* 2 isoenzymes of malate dehydrogenase were found which differ markedly in their response to glucose. One isoenzyme is synthesized only in glucose-repressed cells and disappears during respiratory derepression. The synthesis of the other form starts after glucose has been reduced by assimilation to a concentration of .apprx.1.0 g/l. Fully derepressed cells contain exclusively this second isoenzymic form, which is rapidly inactivated after addition of glucose, probably by an enzymic-catalyzed chemical

modification. Inhibition of derepression by antibiotics indicates that this isoenzyme is synthesized by cytoplasmic and not mitochondrial ribosomes. Both isoenzymes were purified 600-fold with about the same yield to electrophoretic homogeneity. Three mg of pure enzyme were isolated from glucose-repressed as well as derepressed cells of this fission yeast. Thus, the intracellular concentration of the enzymes is about the

same in both physiol. states. The glucose-repressible isoenzyme is therefore 20-fold as active as the isoenzyme synthesized in the presence of glucose. Both isoenzymes possess a mol. weight of 60,000, are composed of 2 subunits identical in mol. weight and show the same sensitivity to inhibition by high concns. of oxaloacetate, corresponding to the cytoplasmic forms of malate dehydrogenase from mammalian cells. The apparent Michaelis consts., and the pH and temperature optima are similar for both forms. The isoenzymes differ in their isoelec. points and their amino acid compns.

AB One isoenzyme of malate dehydrogenase with an isoelectric point of 6.4 was found in glucose-repressed cells of S. pombe. During respiratory derepression the activity of this isoenzyme decreased rapidly in vivo. In the course of this inactivation 2 new forms of malate dehydrogenase with isoelectric points of 6.0 and 5.7 appeared. These 2 enzymic forms disappeared 4 hr after the exhaustion of glucose; probably they are degradation products of the isoenzyme present in glucose-repressed cells. Fully derepressed cells of this fission yeast contained 1 isoenzyme of malate dehydrogenase with an isoelectric point of 5.3. The synthesis of this isoenzyme was initiated at glucose concns. <1.5 g/l.
